

How to select capacitors?

Aside from the capacitance, another thing to consider on how to select capacitors is the tolerance. If your application is very critical, then consider a very small tolerance. Capacitors come with several tolerance options like 5%, 10% and 20%. It is your call which is which.

Can a capacitor be installed in series?

Though there are few cases to install a capacitor in series. In my designs, I am not allowing to a voltage stress of more than 75%. This means, if the actual circuit voltage is 10V, the minimum capacitor voltage I will select is 13.33V ($10V/0.75$). However, there is no such voltage. So, I will go to the next higher level that is 16V.

What is a CeraLink[®] capacitor?

Developed to stabilize the voltage of DC link circuits, our CeraLink[®] capacitors are remarkably compact with PLZT (lead lanthanum zirconium titanate) ceramics as their base materials. They show exceptionally low ESL (Equivalent Series Inductance) values and also have superb heat resistance.

How to use a low ESR capacitor in a bulk network?

Use low ESR capacitors to implement the bulk network. Capacitors with high ESR induce voltage drops of their own due to the current flowing in them. Care must be taken when using very low ESR capacitors together with an input inductor as it may cause instability.

What parameters should be included in the selection of output capacitors?

The most important parameters are the magnitude of the load transient (DI) and the distributed bus impedance to the load. The selection of the output capacitors is determined by the allowable peak voltage deviation (DV). This limit should reflect the actual requirements, and should not be specified lower than needed.

What factors affect capacitor selection?

The transient requirements of your system are very important. The load transient amplitude, voltage deviation requirements, and capacitor impedance each affects capacitor selection. Other important issues to consider are minimizing PCB area and capacitor cost.
