## Battery insulation film technology bottleneck

How can thin-film batteries be coated?

For thin-film battery systems, surface coatings are a simple and effective method. Introducing coating materials onto the surface of Ni-rich layered oxides avoids direct contact with the electrolyte, thus minimizing the parasitic reactions. It also sets a kinetic barrier to O 2 evolution.

What are the components of a thin-film battery?

Each component of the thin-film batteries, current collector, cathode, anode, and electrolyteis deposited from the vapor phase. A final protective film is needed to prevent the Li-metal from reacting with air when the batteries are exposed to the environment.

Can SnSe be used as a thermal barrier in lithium-ion batteries?

Our study introduces a novel composite insulation film engineered to function as a thermal barrier in lithium-ion batteries. While SnSe has been extensively researched as a conventional thermoelectric material [30,31], its integration into a composite for insulation purposes remains largely unexplored.

What is a battery cell insulating layer system?

The battery cell has an insulating layer system that covers the outer surface of the cell housing. The insulating layers are adhered to the housing and also bonded to each other. This provides multiple layers of insulation that can withstand high temperatures and prevent electrical arcing between adjacent cells.

Why do battery cells need a protective film?

In the conventional way, battery cells, especially prismatic cells, are protected by a film. This process is costly and time-consuming and contains several sources of error. For example, condensation can accumulate under the protective film or the formation of unevenness in the bonding process can impair functionality.

How does insulating film work?

The cells are surrounded by an insulating film. Instead of sticking an insulating film on the cell surface, the film is fixed to the cell using a gel layer. This eliminates the need for an adhesive layer between the insulating film and cell. The gel layer also helps prevent wrinkles and bubbles in the insulating film.
