How do mobile energy-storage systems improve power grid security?

Multiple requests from the same IP address are counted as one view. In the high-renewable penetrated power grid, mobile energy-storage systems (MESSs) enhance power grids' security and economic operation by using their flexible spatiotemporal energy scheduling ability.

How do different resource types affect mobile energy storage systems?

When different resource types are applied, the routing and scheduling of mobile energy storage systems change. (2) The scheduling strategies of various flexible resources and repair teams can reduce the voltage offset of power supply buses under to minimize load curtailment of the power distribution system.

What is a mobile energy storage system (mess)?

During emergencies via a shift in the produced energy, mobile energy storage systems (MESSs) can store excess energy on an island, and then use it in another location without sufficient energy supply and at another time, which provides high flexibility for distribution system operators to make disaster recovery decisions.

Can mobile energy storage support the power grid?

Several MESS demonstration projects around the world have validated its ability to support multiple aspects of the power grid. This subsection describes the scheduling of mobile energy storage in terms of theoretical approaches and demonstration applications, respectively.

Can mobile energy storage systems improve resilience of distribution systems?

According to the motivation in Section 1.1, the mobile energy storage system as an important flexible resource, cooperates with distributed generations, interconnection lines, reactive compensation equipment and repair teams to optimize dispatching to improve the resilience of distribution systems in this paper.

How do mobile energy storage systems work?

Mobile energy storage systems work coordination with other resources. Regulation and control methods of resources generate a bilevel optimization model. Resilience of distribution network is enhanced through bilevel optimization. Optimized solutions can reduce load loss and voltage offset of distribution network.

This study investigates the potential of mobile energy storage systems (MESSs), specifically plug-in electric vehicles (PEVs), in bolstering the resilience of power systems during extreme events. While utilizing PEVs as an energy source can offer diverse power services and enhance resilience, their integration with power and transport networks may introduce ...
