

How do photovoltaic anti-backflow systems work?

According to different system voltage levels, photovoltaic anti-backflow systems can be divided into single-phase anti-backflow systems, three-phase and energy storage system ones. In a power system, power is generally sent from the grid to the load, which is called forward current.

What is anti-backflow protection?

Anti-backflow protection is required for high standards in some applications, including DC charging piles, switching power supplies with inductive loads, and equipment for water electrolysis of hydrogen and oxygen.

How does an inverter achieve anti-backflow?

Upon detecting current flow towards the grid, the inverter will reduce its output power until the countercurrent is eliminated, thereby achieving anti-backflow. It is important to note that the CT and meter themselves do not have anti-backflow capabilities; they simply collect data to enable the inverter to adjust its output accordingly.

What is DC/DC anti-backflow protection?

This type of protection can prevent the switching power supply from being damaged when there is a backflow current voltage at the output end of the product. To provide a solution for this, MORNSUN has introduced a new series of DC/DC anti-backflow modules called the FS-A (B)xxW series.

Why is anti-backflow referred to as countercurrent?

Since this current flows in the opposite direction to the conventional one, it is referred to as "countercurrent."

Q: Why is anti-backflow needed? A: There are several reasons to prevent excess electricity generated by the PV system from flowing into the grid:

How does Deye inverter anti-backflow work?

Deye inverter anti-backflow working principle: install an meter with CT or current sensor at the grid-connected point. When it detects that there is current flowing to the grid, it will feed back to the inverter, and the inverter will immediately change its working mode and track from the maximum power point of MPPT.

The anti-backflow solution can effectively avoid this problem and ensure the safe and efficient operation of the energy storage system. Let's take a look at some typical backflow prevention ...

Q: Why is anti-backflow needed? A: There are several reasons to prevent excess electricity generated by the PV system from flowing into the grid: In certain regions, it is ...
