

# Environmental issues of negative electrode materials for lithium batteries

What is a lithium metal negative electrode?

Using a lithium metal negative electrode has the promise of both higher specific energy density cells and an environmentally more benign chemistry. One example is that the copper current collector, needed for a LIB, ought to be possible to eliminate, reducing the amount of inactive cell material.

Are retired lithium-ion batteries a problem?

Retired lithium-ion batteries are rich in metal, which easily causes environmental hazards and resource scarcity problems. The appropriate disposal of retired LIBs is a pressing issue. Echelon utilization and electrode material recycling are considered the two key solutions to addressing these challenges.

Why are lithium-ion batteries a problem?

To address the rapidly growing demand for energy storage and power sources, large quantities of lithium-ion batteries (LIBs) have been manufactured, leading to severe shortages of lithium and cobalt resources. Retired lithium-ion batteries are rich in metal, which easily causes environmental hazards and resource scarcity problems.

Why are negative electrodes more dangerous than positive electrodes?

Compared with positive electrode materials, negative electrode materials are more likely to cause internal short circuits in batteries because of the formation of an SEI layer, dendrites on the ground of the negative electrode and the volume variation of the negative electrode, thus leading to battery failure.

How does internal failure affect the performance of lithium-ion batteries?

Internal failure is an important factor affecting the performance degradation of lithium-ion batteries, and is directly related to the structural characteristics of the cathode materials, including electrode material loss, structural distortion, and lithium dendrite formation.

Why is lithium-ion battery demand growing?

Strong growth in lithium-ion battery (LIB) demand requires a robust understanding of both costs and environmental impacts across the value-chain. Recent announcements of LIB manufacturers to venture into cathode active material (CAM) synthesis and recycling expands the process segments under their influence.

The high capacity ( $3860 \text{ mA h g}^{-1}$  or  $2061 \text{ mA h cm}^{-3}$ ) and lower potential of reduction of  $-3.04 \text{ V}$  vs primary reference electrode (standard hydrogen electrode: SHE) make ...

Highly portable nanoelectronics and large-scale electronics rely on lithium-ion batteries (LIBs) as the most reliable energy storage technology. This method is thought to be ...

# Environmental issues of negative electrode materials for lithium batteries

LIB recycling decreases energy ingesting, and carbon dioxide releases preserve the ecosystem by eradicating the removal and significance of raw materials, reducing ...

As with most of the 2D COFs reported so far, the design and synthesis of some building units with 3D configurations can lead to the emergence of 3D COF materials with ...

Rapidly growing demand for lithium-ion batteries, cost pressure, and environmental concerns with increased production of batteries require comprehensive tools to ...

Lithium-ion batteries, LIBs are ubiquitous through mobile phones, tablets, laptop computers and many other consumer electronic devices. Their increasing demand, mainly ...

Conversion electrodes for lithium-ion batteries are capable of high capacity but low energy efficiency and low voltages are problematic. The electrochemical reactivity of ...

electrode materials, p-type electrode materials are more suitable as a cathode to achieve a high working voltage ( $>3$  V) due to their high redox potential. Moreover, the specific capacity of most ...

Retired lithium-ion batteries are rich in metal, which easily causes environmental hazards and resource scarcity problems. The appropriate disposal of retired ...

The lithium-ion battery (LIB), a key technological development for greenhouse gas mitigation and fossil fuel displacement, enables renewable energy in the future. LIBs ...

1 Introduction. Lithium (Li) metal is widely recognized as a highly promising negative electrode material for next-generation high-energy-density rechargeable batteries ...
