

Full range of UV enhanced photovoltaic cells

Can UC materials improve the energy harvesting capability of PV cells?

Regarding PV applications, the UC materials could considerably enhance the energy harvesting capability of the PV cells as they extend the useable solar spectrum range to the NIR photons in single junction solar cells (Fig. 1).

Can photovoltaics improve light harvesting capability of solar cells?

Photovoltaics (PV) is the leading renewable energy harvesting technology. Thus, there is a remarkable strive to enhance the light harvesting capability of the state-of-the-art solar cells.

Do luminescent layers improve solar cell performance?

Luminescent layers for enhanced silicon solar cell performance: down-conversion Luminescent layers for enhanced silicon solar cell performance: up-conversion Trupke T. et al. Up-and down-conversion as new means to improve solar cell efficiencies.

How is UV intensity attenuated in a PV module?

The spectral analysis, which is based on absorbance/reflectance interactions of incident flux with different material layers of a PV module (Figure 9), shows that the UV intensity at the Si x N y layer is attenuated by a factor of 2 in a module compared with a bare cell.

Can plasmon-enhanced solar cells improve silicon solar cell performance?

Recent advancements in plasmon-enhanced promising third-generation solar cells Modifying the solar spectrum to enhance silicon solar cell efficiency - an overview of available materials Luminescent layers for enhanced silicon solar cell performance: down-conversion Luminescent layers for enhanced silicon solar cell performance: up-conversion

Is upconversion possible in photovoltaics?

Indeed, upconversion in photovoltaics has already been demonstrated in several PV technologies, e.g. first in GaAs solar cells by Gibart et al., later in c-Si cells by Trupke et al., and most recently also in DSSCs by Shan and Demopoulos.

The high-temperature thermal stability and UV stability of inverted organic solar cells are simultaneously enhanced. The crosslinking of PC 61 PeA enhances the diffusion ...

Another effective strategy to improve the device performance is rare-earth doping, which can expand the spectral response range by down or up conversion [17], [18], ...

A proper band alignment of the photovoltaic devices with architecture of fluorine-doped tin oxide/TiO₂

/BiSCl/(I 3 - /I -)/Pt using the BiSCl-nanorod array film exhibits a power ...

In another recent numerical study Prabhathan and Murukeshan [39] demonstrated the possibility to reach a broadband absorption enhancement of 153% for an ...

In this study, we present a novel approach to improve the performance of perovskite solar cells (PSCs) by exploring the synergistic effects of ultraviolet (UV) light and ...

A layer-by-layer organic photovoltaic device with excellent performance is created by tuning individual layers. Kumari et al. report 16.21% efficiency, surpassing the bulk ...

Degradation from ultraviolet (UV) radiation has become prevalent in the front of solar cells due to the introduction of UV-transmitting encapsulants in photovoltaic (PV) module ...

With this, 72% absorption in the 400-600 nm spectral range was achieved. Crudgington et al. reported on using a Ag nanoparticle array as a plasmonic back reflector in a ...

1 Introduction. According to the International Technology Roadmap for Photovoltaics, [] passivated emitter and rear solar cells (PERCs) dominate the current market ...

When paired with acceptor 4,6-bis(3,5-di-4-pyridinylphenyl)-2-methylpyrimidine in an inverted architecture with an indium tin oxide top electrode and an organic optical outcoupling layer, the three best-performing ...

Plasmonic structures for light manipulation at sub-wavelength scale have received great interest in the field of photovoltaic (PV) solar cells for their potential to ...
