

Which electrode materials are used for high-energy rechargeable lithium batteries?

This study describes new and promising electrode materials, Li_3NbO_4 -based electrode materials, which are used for high-energy rechargeable lithium batteries. Although its crystal structure is classified as a cation-disordered rocksalt-type structure, lithium ions quickly migrate in percolative network in bulk without a sacrifice in kinetics.

Is a silicon electrode suitable for a high-capacity negative electrode in lithium-ion batteries?

In order to examine whether or not a silicon electrode is intrinsically suitable for the high-capacity negative electrode in lithium-ion batteries, a thin film of silicon formed on copper foil is examined in a lithium cell. Figure 1 shows the charge and discharge curves of a 1000 nm thick silicon electrode examined in a lithium cell.

What is a lithium ion battery?

Lithium-ion batteries (LIBs) are generally constructed by lithium-including positive electrode materials, such as LiCoO_2 and lithium-free negative electrode materials, such as graphite.

What is a negative-electrode material?

The negative-electrode material is usually graphite because the operating voltage is very close to that of a lithium electrode, about 0.1 V vs Li, and the graphite electrode well cycles with the rechargeable capacities more than 300 mAh g⁻¹.

Is Li-Si a promising lithium-containing negative electrode?

Due to the smaller capacity of the pre-lithiated graphite (339 mAh g⁻¹ -LiC₆), its full-cell shows much lower capacity than the case of Li₂₁Si₅ (0.2-2 mm) (Fig. 6b), clearly indicating the advantage of the Li-rich Li-Si alloy as a promising lithium-containing negative electrode for next-generation high-energy LIBs.

What is a lithium electrode made of?

The electrodes consisted of 90 wt % "SiO" -carbon composite material, 2 wt % carbon black, and 8 wt % polyvinylidene fluoride (PVdF) on copper foil was examined in lithium cells. The electrolyte was 1 M LiPF₆ dissolved in the mixed solvent of ethylene carbonate (EC) and diethyl carbonate (DEC) by the volume ratio of 3:7.

Negative Electrodes Graphite : 0.1: 372: Long cycle life, abundant: Relatively low energy density; inefficiencies due to Solid Electrolyte Interface formation: Li₄Ti₅O₁₂ 1.5: 175 ...

Compared with current intercalation electrode materials, conversion-type materials with high specific capacity are promising for future battery technology [10, 14]. The ...

The material is formed in a pure state with an average size of 10 nm. The electrochemical studies are conducted for its use as negative electrode for Li-ion batteries. ...

In the search for high-energy density Li-ion batteries, there are two battery components that must be optimized: cathode and anode. Currently available cathode materials for Li-ion batteries, such as $\text{LiNi}_{1/3}\text{Mn}_{1/3}\text{Co}_{1/3}\text{O}_2$ (NMC) or $\text{LiNi}_{0.8}\text{Co}_{0.8}\text{Al}_{0.05}\text{O}_2$ (NCA) can provide practical specific capacity values (C_{sp}) of 170-200 mAh g⁻¹, which produces ...

The silicon-based materials were prepared and examined in lithium cells for high-capacity lithium-ion batteries. Among the materials examined, "SiO"-carbon composite showed remarkable improvements ...

1 Introduction. Lithium-ion batteries (LIBs) revolutionized our lives since they first entered the market in 1991 by Sony. [] Due to their low self-discharge rate, low maintenance, free of memory effect, high energy density and long cycle lifespan, they play an important role in various applications including in consumer electronics (laptops, telephones, camcorders etc.), ...

This study offers a facile solution to the challenges facing alloying-type negative electrode materials with huge volume changes by confining volume change, enhancing electric ...

Here, by using a scalable high-energy ball milling approach, we report a practical hierarchical micro/nanostructured P-based anode material for high-energy lithium-ion batteries, which possesses a ...

Most crucially, graphite has a lower specific capacity of 320 mAhg⁻¹ (with the specific capacity having stretched to the limit and cannot meet the continuous large-current discharge capability) and lower cycling capabilities than emerging materials, which has seen a shift in attention towards other anode materials, especially with the emergence of high ...

There are three Li-battery configurations in which organic electrode materials could be useful (Fig. 3a). Each configuration has different requirements and the choice of material is made based on ...

Abstract The silicon-based materials were prepared and examined in lithium cells for high-capacity lithium-ion batteries. Among the materials examined, "SiO"-carbon composite showed remarkable ...
