

How to change the energy storage battery to hard disk power supply

How do I connect extra batteries to my laptop?

There's no standard connector for extra batteries - they need to interact with the charging system which not standardized across laptops. Devices like a 2.5" SATA HDD /SSD plug into a power connector that supplies them with regulated 12V,5V,and 3.3V power. That's the same power bus that powers other devices.

How to power a SATA hard drive externally?

Learning how to power a SATA hard drive externally is easy with the right mix of hardware. An adapter is best if you want to transfer data from a failing drive. Choose a docking station if you regularly need to pull and write data to internal disks. An enclosure is your best bet if you need a portable option for your internal drive.

How do you Power a 3.5 inch hard drive?

3.5" hard drives get their power from a SATA power cable which consists of 12V,5V (and sometimes 3.3V,but apparently I don't need that),and two ground wires. Basically I want to take some Molex-to-Sata power adapters and cut off the Molex end,and connect them to a power supply.

Can a PSU supply power to a HDD?

Yes,in theory you can supply power for it from outside power source,12v for 3.5" and 5v for 2.5" HDDs. but that would pose other problems like making it switch on and off together with system Something like this for instance If your PSU doesn't have enough "spare" power for another HDD,you have a bigger problem than just that.

Can you connect a battery to a laptop's internal power supply?

You can't usefully connect a battery to the regulated output side of the laptop's internal power supply. The laptop will maintain the 12V rail at about 12V regardless of whether it's plugged into the wall or not. A hypothetical battery wouldn't know whether to charge itself or try to supply current on the 12V rail.

How do SATA hard drives work?

A SATA connector splits into two parts. The first section,with six pins,transfers data,while the other 15 pins are used for power. When used internally,the data and power cables/connectors plug into the drive's SATA connector and connect to the motherboard and power supply on the other end. SATA hard drives are made for internal use.
