

Lithium battery boost circuit driving motor

How to boost battery voltage?

The battery charging circuit and the DC to DC boost converter are the two main parts of this circuit. Battery voltage can be boosted from 3.7 volts to between 4.5 and 6 volts by using the Booster part. USB Type A Female Connector on the Booster side, and Micro USB 2.0 B type 5 Pin Connector on the Charger side were used in this circuit.

What causes large motor currents in a battery system?

Large currents from motors create two problems in battery systems: they use energy unproductively, and they can cause the system to prematurely go into a low-battery lockout condition because of the voltage drop across R BAT. There are two main causes of large motor currents: inrush current during motor startup and stall current.

What is the battery voltage range available to the motor driver?

The battery voltage range available to the motor driver depends on the battery chemistry, depth of discharge, temperature, load current, and the number of battery cells connected in series or parallel.

Is there a fast active cell balancing circuit for lithium-ion battery packs?

This article proposes a fast active cell balancing circuit for lithium-ion battery packs. The proposed architecture incorporates a modified non-inverting buck-boost converter to improve balancing efficiency, an equivalent circuit model technique for battery designing, and an extended Kalman Bucy filter for accurate SOC estimation.

How can you extend battery life in battery-powered motor systems?

Learn motor driver design techniques to help extend battery life in battery-powered motor systems. Many battery-powered systems and Internet of Things (IoT) applications--such as smart meters, smart sanitation products, video doorbells, robotic toys, personal hygiene products, and electronic locks--contain a motor, solenoid, or relay.

Can a module charge a lithium battery?

For most of our development boards, the module can safely charge a lithium battery and boost its output voltage to a regulated 5V. Although the charging current of our module is set at 1A, it can be easily modified to provide up to 2.5A if necessary and supported by the battery, so long as it is compatible with the module.

Or a charger IC with a "power-path" feature built-in. E.g. TI has a few chips such as bq25890, bq25606 etc. that do this. The features these have, such as the OTG support, may be an overkill, but if space is at premium it is likely worth it than hacking up a discrete solution.
