Material for making lead-acid battery capacity extender

What are expanders in lead-acid batteries?

Introduction Expanders are materials that are added to the negative plates of lead-acid batteries to improve their performance and life. They are generally composed of three principal ingredients, viz., barium sulfate, lignosulfonate and carbon black, each of which has a specific function in the negative plate, .

What are battery expanders?

Abstract: Battery expanders are little understood additives to the lead acid battery. A brief history of their development is discussed in conjunction with a novel battery plate additive. The synthetic additive replaces or is used in addition to the normal organic expander in the negative plate.

What raw materials are used in lead-acid battery production?

The key raw materials used in lead-acid battery production include: LeadSource: Extracted from lead ores such as galena (lead sulfide). Role: Forms the active material in both the positive and negative plates of the battery. Sulfuric Acid Source: Produced through the Contact Process using sulfur dioxide and oxygen.

Can graphene nano-sheets improve the capacity of lead acid battery cathode?

This research enhances the capacity of the lead acid battery cathode (positive active materials) by using graphene nano-sheets with varying degrees of oxygen groups and conductivity, while establishing the local mechanisms involved at the active material interface.

How much graphite should a battery expander be?

Specifically,in valve regulated lead-acid batteries for hybrid electric vehicles,the improved expander formulations include approximately 0.2% to 6% graphite or mixture of carbon and graphite,and preferably approximately 1% to 5%. In particular,improved expanders having approximately 1% to 3% graphite is preferred.

What is a battery plate additive?

A brief history of their development is discussed in conjunction with a novel battery plate additive. The synthetic additive replaces or is used in addition to the normal organic expander in the negative plate. The additive adds strength to the plate making process, reducing scrap and reducing dust coming from the plates.
