

Can deep reinforcement learning be used for energy management?

Comparative study with a reinforcement learning-based energy management strategy. In this paper, we propose an energy management strategy based on deep reinforcement learning for a hybrid battery system in electric vehicles consisting of a high-energy and a high-power battery pack.

Does reinforcement learning improve battery management?

While this study does not encompass a comprehensive comparison of all optimization methods, it highlights the deliberate choice of reinforcement learning for its adaptability and learning capabilities, which are particularly beneficial for the dynamic and real-time requirements of battery management systems. Fig. 9.

Can new battery technologies reshape energy systems?

We explore cutting-edge new battery technologies that hold the potential to reshape energy systems, drive sustainability, and support the green transition.

How a deep reinforcement learning based bidding is used in Energy Arbitrage?

After the error compensation, additional battery control is applied to utilize the energy arbitrage process considering the energy price. As there are energy price and renewable generation uncertainties, we propose a deep reinforcement learning based bidding combined with control, called DeepBid, for sequential decision making under uncertainty.

Is there a way to balance battery cells using reinforcement learning?

There are also a few works on active balancing using reinforcement learning. Lu et al. use DQN to balance multiple battery cells connected in series using a redundant battery which can become parallel to each of the cells. They also consider balancing the pack without too much switching. The downside of their work is the need for fine-tuning.

What is reinforcement learning in energy management?

State-of-the-art learning-based methods, e.g., reinforcement learning (RL), are becoming one of the most popular methodologies for model-free and real-time energy management. They can learn from historical experience and gradually adapt the strategy by maximizing the estimated total rewards.

The trade-off between charging duration and battery overheating is a critical issue in battery charging, which is essentially a multiobjective decision problem. In this article, we propose a battery charging strategy based on deep reinforcement learning (RL). In contrast to conventional methods, RL technology empowers our approach to adapt to dynamic ...

In Section II, a new integrated energy system is designed, and each unit's fundamental structure and mathematical model are built. To optimize the energy, economic, and environmental benefits of the integrated

energy system, the optimal scheduling problem is solved using a deep reinforcement learning algorithm, which is described in detail in ...

Since battery degradation is unavoidable during utilization, battery management is required to minimize it. This paper proposes state-of-health (SOH)-aware battery management based on deep reinforcement learning. Our experimental results demonstrate an average battery lifetime improvement of 11.2%.

Accurate estimation of battery degradation cost is one of the main barriers for battery participating on the energy arbitrage market. This paper addresses this problem by using a model-free deep reinforcement learning (DRL) method to optimize the battery energy arbitrage considering an accurate battery degradation model. Firstly, the control problem is formulated as a Markov ...

In this paper, we propose an energy management strategy based on deep reinforcement learning for a hybrid battery system in electric vehicles consisting of a high ...

In order to solve these problems, this study designed a secondary throttle (ST) orifice opening control at the refrigerant outlet of the battery branch and proposes a new cooling control strategy based on a deep reinforcement learning (RL) algorithm to control the compressor speed (N compressor) and ST orifice opening. We also compared the performance of the RL control ...

Data show that Guizhou's large-scale new energy battery and material industry realized an industrial output value of 53.28 billion yuan in 2022. By 2025, Guizhou aims to ...

A framework using Reinforcement Learning (RL) to control the operation of a battery storage device in a microgrid and learns an optimal energy management policy by using its past experiences is presented. The intermittent nature of Renewable Energy Sources (RES) leads to a mismatch between electricity supply and demand, thus, there is a need for energy storage and ...

Request PDF | Bi-level optimization of charging scheduling of a battery swap station based on deep reinforcement learning | With the rapid increase of in the number of electric vehicle (EV ...

An improved actor-critic-based reinforcement learning is proposed for battery scheduling, where a distributional critic net is applied for faster and more accurate reward estimation under uncertainties, and a policy net incorporating protective secondary control is adopted to satisfy security constraints. The home energy system today involves multiple ...

Numerical tests show that the proposed approach outperforms conventional reinforcement learning algorithms, as well as the rule-based battery scheduling approach while ...
