

What is failure analysis & diagnosis of PV strings?

The failure analysis and diagnosis of PV strings in PV systems initially focused on studies with specific threshold settings.

What data is used to analyze a PV string?

The analysis is carried out by using only the real-time data of  $V_{mp1}$ ,  $I_{mp1}$ ,  $T_m$ , and  $G$ , and do not require the performance history of the string, or intercomparison with the results of other PV strings or climatic data.

Why do we need a real-time detection of a PV system?

Quick detection, preferably real-time detection, of the changes in the performance is desired in order to confirm the sound operation of the PV system, and to detect the symptom of those degradation before the output power significantly deteriorates.

How do feature twins and visual twins address string failures in photovoltaic systems?

Based on the concept of multi-twins, we propose the notions and methods of feature twins and visual twins to address the phenomenon of string failures in photovoltaic systems. By describing the three types of failure processes through features and visuals, these methods are applied to subsequent classification and diagnosis tasks.

How accurate is photovoltaic failure analysis based on deep neural networks?

Timely and accurate failure analysis of photovoltaic (PV) systems is crucial for ensuring the stable operation of power grids. However, existing failure analysis and diagnosis algorithms based on deep neural networks excessively rely on high-quality failure state data collected by sensors.

Why do we need a failure analysis and diagnosis of PV systems?

These issues can lead to fluctuations in system power generation efficiency and may even adversely affect the stability of the power grid. Therefore, conducting timely and accurate failure analysis and diagnosis of PV systems based on measurement data from various electrical sensors holds significant research value and practical importance.

PDF | On Jan 1, 2023, Jun Wu and others published Ghost-RetinaNet: Fast Shadow Detection Method for Photovoltaic Panels Based on Improved RetinaNet | Find, read and cite all the research you need ...

Comparison of detection effects between the proposed model and the YOLOX and DAB-DETR models Fig. 12 shows the detection performance of different models when only foreign objects are detected.

"Battery string" and "PV panel string" in Table 1 represent the same meaning. As can be seen from Table 1,

under the same experimental conditions, the algorithm PA-YOLO proposed in this paper has a significantly ...

The utility model discloses a detection mechanism of a photovoltaic cell string repairing machine, which comprises a frame, wherein the frame is fixedly connected with a workbench, the workbench is provided with a transparent detection part for placing a photovoltaic cell string, a sucker is movably connected above the detection part, a camera is arranged under the ...

Electroluminescence imaging can obtain high-resolution images of photovoltaic modules, and it is of great significance to obtain EL images of photovoltaic modules through drones for intelligent and refined defect detection. The EL images have a complex texture background with high resolution and non-uniformity, and at the same time, defects such as ...

Over the past few years, the power electronic converters have gained significant attraction among researchers, especially as an interface between distributed generation (DG) systems and the grid.

Faults in photovoltaic arrays are known to cause severe energy losses. Data-driven models based on machine learning have been developed to automatically detect and diagnose such faults.

DC arc faults, especially series arcing, can occur in photovoltaic (PV) systems and pose a challenging detection and protection problem. Machine learning based methods are increasingly being used ...

The paper proposes a machine learning-based stacking classifier (MLSC) for accurate fault diagnosis of PV strings. Specifically, for the operating state of PV modules, the ...

Monitoring systems are essential to maintain optimal performance of photovoltaic (PV) systems. A critical aspect in such monitoring systems is the fault diagnosis technique being used.

In response to the problems of low detection accuracy and inability to accurately locate photovoltaic strings caused by complex backgrounds, dense target distri
