Principle of solar power generation by power distribution cabinet

What are the components of a photovoltaic system?

Policies and ethics The photovoltaic (PV) power generation system is mainly composed of large-area PV panels, direct current (DC) combiner boxes, DC distribution cabinets, PV inverters, alternating current (AC) distribution cabinets, grid connected transformers, and connecting cables....

How solar energy is generated?

The PV technology convert visible spectrum to electricity and thermal collectors use both infrared and visible spectrum for energy generation. So the energy generation from solar radiation can be in the form of electrical energy or thermal Energy. The various conversion paths of solar energy is described in the Fig.2

How can solar energy be harnessed?

This energy received from the sun can be harnessed directly or indirectlyusing various technologies for thermal applications as well as for converting into electricity by the means of photovoltaic (PV) systems. Over the years the photovoltaic technology advanced a lot and the efficiency of solar cell has considerably improved.

How does solar photovoltaic work?

The solar photovoltaic works on the principle of photovoltaic effect. It is the physical and chemical property or phenomenon in which electromotive force is generated in the non-homogeneous materials with the illumination of light of a specific wave length. This effect produces voltage and electric current in a material upon exposure to light.

What are the three basic principles used for solar space heating?

The three basic principles used for solar space heating are Collection of solar radiation by solar collectors and conversion to thermal energyStorage of solar thermal energy in water tanks,rock bins,etc. Distribution by means of active (pumps) or passive (gravity) methods. 5.6 Principle of solar dryer

How to generate thermal energy from solar energy?

The generation of thermal energy from solar can be realized using various solar reflecting collectors. Most of the technology works on the principle of reflection, radiation and convention or based on the thermosiphon effect. Sun is a gigantic star, with diameter of 1.4 million kilometer releasing electromagnetic energy of about 3.8 x 1020 MW.
