

Reasons for using glue filling technology in batteries

Why do batteries need adhesives & sealants?

The adhesives need to allow the manufacturing as well as the structural and crash-durable joining of the battery enclosure. Adhesives and sealants are used to seal the battery from external environments and protect the cells and electronic parts inside the battery.

What are battery adhesives and how do they work?

According to Billotto, these adhesive materials act as interfaces between the battery cells and the cooling plates, ensuring heat is efficiently dissipated during charging and discharging. These adhesives enhance battery longevity by helping keep the batteries within the optimal temperature range (typically 35-60°C).

How can adhesives improve EV battery design?

Advanced adhesives and sealants like those from DuPont can help advance sustainability. An essential contribution of adhesives to EV battery design is that they allow for greater simplicity. For example, adhesives help reduce or eliminate mechanical fasteners, reducing battery complexity.

Where is thermal adhesive used in a battery?

The heat extracted using adhesive originates from electrical resistance in the battery's electrodes, electrolyte, current collectors, busbars, and various interconnections. For this reason, thermal adhesives are used at several locations in battery modules, such as between individual cells, or between cells and cooling plates.

What makes a good battery adhesive?

On top of the thermal conductivity the adhesive further needs to show a good structural strength paired with a high elongation at break to maintain the mechanical structure over the lifetime of a battery also under load (e.g. vibration).

Where are adhesives used in a battery module?

Adhesives are used at several locations in battery modules to help dissipate heat, insulate electrical components, seal off against environmental damage, and create strong structural bonds. Here are common examples of where they are used:
