

Can stretchable organic solar cells power wearable devices?

Stretchable organic solar cells for powering wearable devices have been achieved by blending a ductile donor semiconductor polymer with a plasticizing small-molecule acceptor to overcome the inherent brittleness of the photoactive components.

What is a stretchable solar cell?

A stretchable solar cell was unveiled by researchers at Saudi Arabia's King Abdullah University of Science and Technology in January. The Saudi group claimed to have stretched a crystalline silicon cell's surface by around 95% while maintaining conversion efficiency of approximately 19%.

Can stretchable solar cells be used as a power source?

The newly developed polymer is expected to play a role as a power source for next-generation wearable electronic devices. With the market for wearable electric devices growing rapidly, stretchable solar cells that can function under strain have received considerable attention as an energy source.

What are flexible organic solar cells?

Flexible organic solar cells, particularly those based on the PM6:Y6:BCP material system, have a wide range of potential applications and broader implications for the field of renewable energy and wearable technology.

How are stretchable organic solar cells made?

The fabrication of Stretchable Organic Solar Cells: Photovoltaic devices were prepared with two conventional structures of PET/PH1000 (70 nm)/PEDOT: PSS/Active layer (80 nm)/EGaIn and PET/silver nanowires/PH1000/PEDOT: PSS/Active layer (80 nm)/EGaIn.

What are flexible and stretchable organic solar cells (foscs & soscs)?

Use the link below to share a full-text version of this article with your friends and colleagues. Learn more. Flexible and stretchable organic solar cells (FOSCs and SOSCs) hold immense potential due to their versatility and applicability in emerging areas such as wearable electronics, foldable devices, and biointegrated systems.

KAIST researchers create a breakthrough in solar energy: a stretchable solar cell that converts energy with 19% efficiency, even when stretched up to 40% - ideal for wearable ...

High power conversion efficiency (PCE) and mechanical robustness are dual requisites for wearable applications of organic solar cells (OSCs). Here, we simultaneously achieve high electronic and mechanical performances in OSCs using conjugated polymer donors (P D s) consisting of electroactive rigid and soft blocks. Specifically, we integrate rigid and soft ...

Stretchable organic solar cells (SOSCs) have advanced rapidly in the last few years as power sources required to realize portable and wearable electronics become available. Through rational ...

Flexible and stretchable organic solar cells (FOSCs and SOSCs) hold immense potential due to their versatility and applicability in emerging areas such as wearable electronics, foldable devices, and biointegrated systems. Despite these promising applications, several challenges remain, primarily related to the mechanical durability, material ...

Engineers have succeeded in implementing a stretchable organic solar cell by applying a newly developed polymer material that demonstrated the world's highest ...

Stretchable organic solar cells for powering wearable devices have been achieved by blending a ductile donor semiconductor polymer with a plasticizing small-molecule acceptor to overcome ...

A new stretchable solar cell developed by researchers at the Center for Emergent Matter Science at Riken University in Japan can stretch to nearly 1.5 times its original size with only a 20 ...

Scientists make groundbreaking discovery while working on stretchable solar cells: "This came as a nice surprise for us" Kristen Lawrence Mon, November 11, 2024 at 10:30 AM UTC

The cell's power conversion efficiency drops by only 20% when the solar cell is stretched by 50% (i.e., stretched to 1.5 times its original, unstretched length). Furthermore, it retains 95% of its initial power conversion ...

The research team tackled these challenges by developing a new type of organic solar cell (OSC). These lightweight, flexible power sources can be processed in ...

A new stretchable organic solar cell may offer the efficient power needed for the next generation of wearable devices, according to a team of international researchers. Led by Zhenye Wang, a researcher at the Wuhan National Laboratory for Optoelectronics, Huazhong University of Science and ...
