

What is a power substation DC system?

Power substation DC system consists of battery charger and battery. This is to verify the condition of battery and battery charger and commissioning of them. Following instruments will be used for testing: Multimeter. (Learn how to use it) Battery loading unit (Torkel-720 (Programma Make) or equivalent).

How do students learn station batteries?

The students are first introduced to station batteries in their ET 180 Substation Equipment course. As part of this course, the students tour four substations and a utility control center. At each substation they are shown the battery bank and the maintenance, safety precautions, and protection of the battery bank is discussed.

How to test a battery in a substation DC system?

To test a battery in a substation DC system, first perform a visual inspection: cleanliness of the battery is checked, and the electrolyte level is verified as specified on the individual cells. Ensure the tightness of cell connections on individual terminals. The load current, minimum voltage of the battery system, ampere-hour, and duration are preset in the test equipment using the keypad.

How often should a substation battery be inspected?

To insure proper operation, substation batteries need to be inspected and maintained. Items to be inspected monthly include: the specific gravity and electrolyte temperature of 10% of the cells of the battery bank. Figure 1. Battery Bank Seen on a Tour of a Substation Control Room

Which test is necessary for the condition assessment of a battery string?

The essential test for the condition assessment of a battery string is the capacity test which can be carried out using the BLU series of Battery Load Units.

What is a battery discharge test?

A discharge test is that in which the battery delivers a current to a load to determine its ability to meet specific criteria such as duty cycle, service or a determined capacity before or at reaching its end of discharge voltage. The voltage of each cell should be monitored throughout the discharge to identify weak cells.

Rather than succumb to rising replacement battery costs or rely on backup systems, our instrumentation and software systems can measure, trend, and manage the life cycle of cells in a cost-effective manner. And there's no need ...
