

What is a ceramic feedthrough capacitor?

Ceramic feedthrough capacitor with cable lug and a capacitance of 1 nF. A feedthrough is a conductor used to carry a signal through an enclosure or printed circuit board. Like any conductor, it has a small amount of capacitance.

What is a feedthrough capacitor?

This falls under the category of electromagnetic control (EMC). Some feedthrough capacitors are used in assemblies that also include inductors. This permits the use of the various filter arrangements such C-type filters, LC-type filters, Pi-type filters and T-type filters (see below image). Feedthrough capacitor filters. (Image: Author.)

What is the difference between A feedthrough capacitor and a filter?

In contrast, a feedthrough capacitor provides superior high-frequency filtering. The feedthrough capacitor has a very small parasitic inductance, a very low bypass impedance, and (because of its isolation mounting) it eliminates coupling between its input and output. For simple, noncritical filtering, discrete filter circuitry can be used.

What are RF feedthrough capacitors used for?

RF feedthrough capacitors are mostly used for high power applications such as dielectric and induction heating equipment, plasma generators, and radio broadcast transmitters. They are also widely used for matching high power tuned circuits, bypassing and coupling RF circuits, and coupling antenna circuits.

What is the inductance of a feedthrough capacitor?

The inductance of these components is in the series branch. Feedthrough capacitors are commonly used in today's AC/DC supply lines to suppress harmful interference. They are also widely used in electronic circuits for base stations, telephone exchanges, shielded rooms, power supplies, and so on.

What are some examples of feedthrough capacitors & other filters?

Signals, data lines, and AC power lines, telecommunications equipment, microwave filters, industrial computers, and composite circuit filter components are all examples of where feedthrough capacitors and other filters are employed.
